

analytics.js

```
(function () {  
  const page = window.location.pathname;  
  const time = new Date().toLocaleTimeString();  
  
  console.log("📊 Analytics");  
  console.log("Page viewed:", page);  
  console.log("Time:", time);  
  
  // Store page views in the browser  
  const views = JSON.parse(localStorage.getItem("pageViews") || "[]");  
  
  views.push({  
    page: page,  
    time: time  
  });  
  
  localStorage.setItem("pageViews", JSON.stringify(views));  
  console.log("Total page views:", views.length);  
})();
```

In basics this script is just logging what page im viewing, time for the log, and saving total page views to localStorage, and also console logging the views. And yes, its made by ChatGPT, just for testing purposes of this assignment.

```
return (  
  <div style={inlineStyle}>  
    <Script src="/analytics.js" strategy="afterInteractive" />  
    <Image  
      className={`w-[200px] h-[100px] m-2 ${theme === "light" ? "" : "invert"}`}  
      src="../../next.svg"  
      alt="Next.js logo"  
      width={100}  
      height={20}  
      priority  
    />  
    {children}  
  </div>  
)
```

I chose afterInteractive strategy, because this script is not needed before the page is actually interactive
